

Basic ListViews

ListViews are the most common way to show a undetermined list of data to a user in a mobile environment. Get your feet wet and start using this unique and powerful UI

Procedure

1. Download DeltaListViews.zip, unzip it , and open it in Android Studio
2. Save a reference to *myListView*.
3. Create a new ArrayAdapter and pass it the 3 things it needs:
 - A context (Your Activity inherits from Context)
 - A Layout (android.R.layout has some built in ones)
 - An array of strings (myStringArray is one)
4. Connect the ListView to the Adapter by using the method `setAdapter()`.
5. Use `setOnItemClickListener` to set an event listener on the ListView for when someone clicks an item. Display that string in the Log or use Toast to show what was selected
6. Go tell someone you're getting pretty good at Android.
